1. Introduction

Truth or Dare Game is a simple text-based Python program designed for entertainment. It asks the user to enter player names separated by commas. The program randomly selects a player and lets the user choose Truth or Dare. It then displays a random question or challenge and allows the game to continue until the user chooses to stop.

2. Objectives of the Study

General Objective

To develop a simple Truth or Dare game using Python.

Specific Objectives

The project aims to:

1. Accept player names entered by the user.
2. Randomly select a player, truth question, or dare challenge.
3. Use conditional statements to process the user's choice.
4. Allow the game to repeat until the user chooses to stop.

3. Scope and Limitations

The program accepts player names typed on one line and separated by commas. It randomly selects a player and displays a truth question or dare challenge based on the user's choice. The program runs in the console and does not include a graphical interface, score system, or automatic turn order. It also does not verify whether the entered player names are valid.

4. Definition of Terms

Python: A programming language used to create the game.

random: A Python module used to randomly select a player, truth, or dare.

List: A collection of items stored in one variable, such as players, truths, and dares.

input(): A function that receives text typed by the user.

while loop: A loop that repeats the game while the user chooses to play again.

if/elif/else: Conditional statements used to check the user's choice.

Truth: A question randomly selected from the truths list.

Edit with WPS Office

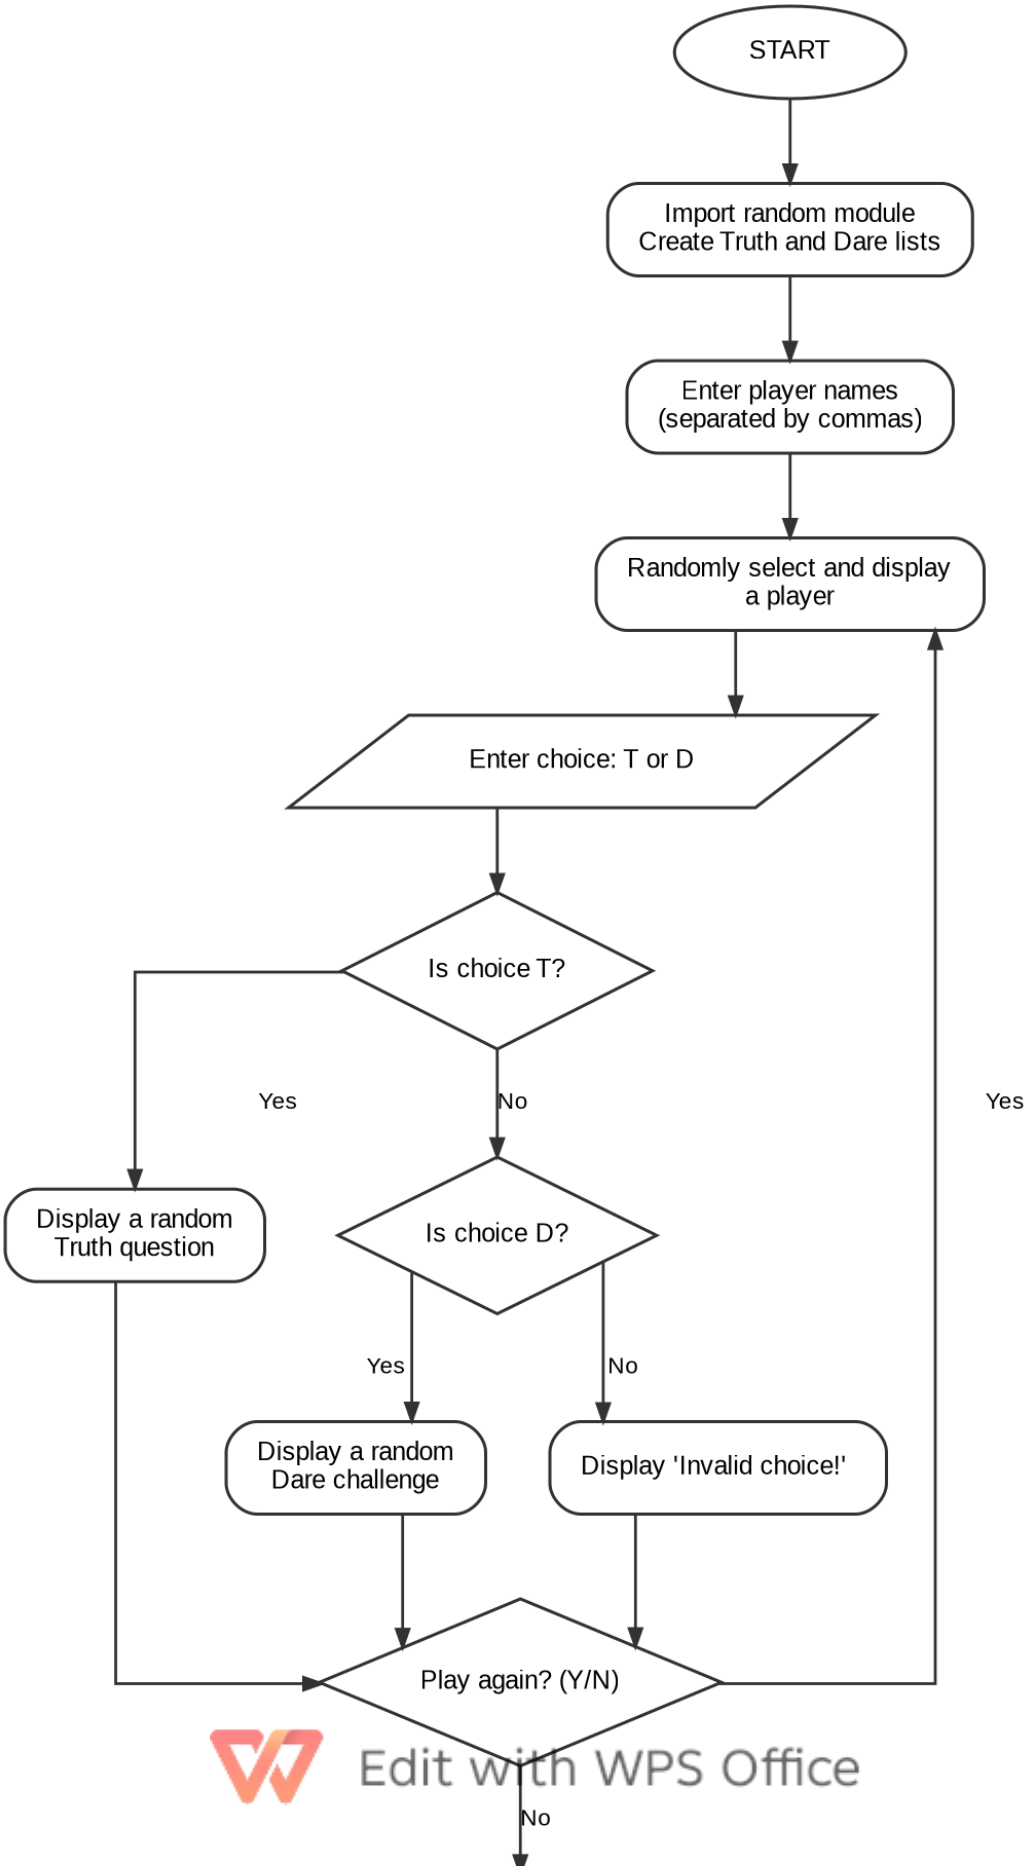

Dare: A challenge randomly selected from the dares list.

5. Flow of the Data

The program imports the random module and prepares the truth and dare lists. The user enters player names, and the program randomly selects a player. The user then chooses Truth or Dare. Depending on the choice, the program displays a random question or challenge, or an invalid-choice message. Finally, the program asks whether to play again. If the answer is Y, the game repeats; otherwise, it ends.

TRUTH OR DARE — DATA FLOW

Edit with WPS Office

6. Key Features

- Accepts multiple player names separated by commas.
- Randomly selects a player for each round.
- Randomly displays a truth question or dare challenge.
- Uses T for Truth and D for Dare.
- Allows the user to continue by entering Y or stop with another response.
- Displays an invalid-choice message when the input is not T or D.

7. Source Code

```
import random

players = input("Players: ").split(",")
truths = ["Biggest fear?", "Crush?", "Secret talent?"]
dares = ["Sing a song!", "Dance!", "Tell a joke!"]

while True:
    print("\nPlayer:", random.choice(players).strip())
    choice = input("Truth or Dare? (T/D): ").upper()

    if choice == "T":
        print(random.choice(truths))
    elif choice == "D":
        print(random.choice(dares))
    else:
        print("Invalid choice!")

    if input("Again? (Y/N): ").upper() != "Y":
        break
```

8. Sample Output

```
Players: Ana, Ben, Carlo

Player: Ben
Truth or Dare? (T/D): T
Crush?
Again? (Y/N): Y

Player: Ana
Truth or Dare? (T/D): D
Dance!
Again? (Y/N): N
```

Note: The selected player and the displayed truth or dare may differ each time

Edit with WPS Office

because the program uses random.choice().

9. Conclusion

The Truth or Dare Game demonstrates basic Python concepts, including lists, user input, random selection, conditional statements, and a while loop. It provides a simple interactive game and helps practice the fundamentals of Python programming.
